Continuous variation vs discontinuous variation Continuous And Discontinuous Variation Biologymad

Discontinuous variation is controlled by alleles of a single gene or a small number of genes. The environment has little effect on this type of variation. Continuous variation In continuous variation there is a complete range of measurements from one extreme to the other. Height is an example of continuous variation

Continuous and discontinuous variation - Biologymad

Variation is the differences between individuals within a species. This can be caused by inherited or environmental factors. Variation can be continuous or discontinuous.

show continuous variation, and some show discontinuous variation. Continuous variation. For any species, a characteristic that changes gradually over a range of values shows continuous variation.

Continuous and discontinuous variation - Higher tier only ...

Continuous and discontinuous variation Variation, the small differences that exist between individuals, can be described as being either discontinuous or continuous. Discontinuous variation This is where individuals fall into a number of distinct classes or categories, and is based on features that cannot be measured across a complete range.

7. The continuous variations are also called fluctuations. 8. When represented graphically, continuous variation gives a smooth bell shaped curve. 9. They are very common. Discontinuous Variations: 1. A mean or average is absent in discontinuous variations. 2. The direction of discontinuous variations is unpredictable. 3.

Differences between Continuous and Discontinuous ...

Continuous and discontinuous variation Some of the features of the different organisms in a species show continuous variation, and some show discontinuous variation.

Continuous and discontinuous variation - Variation and ...

Discontinuous characteristics are rare in humans and other animals, but are more common in plants. Some examples are human blood group, detached ear lobes, flower colour, seed colour, etc. these characteristics are very useful for geneticists because they give clear-cut results. Discontinuous variation is a cooperating factor in the process of evolution. The main difference between continuous and discontinuous variation is that continuous variation has no limit on the value that can occur within a population while discontinuous variation has distinct groups for organisms to belong to. <https://www.differencebetween.com/difference-between-continuous-and-vs-discontinuous-variation/>.

FORM4 BIOLOGY Lesson2 CONTINUOUS AND DISCONTINUOUS VARIATION

Continuous Variation is when there are very many small degrees of difference for a particular characteristic between individuals and they are arranged in order and can usually be measured on a scale; Examples include height, mass, finger length etc. where there can be many 'inbetween' groups; Discontinuous Variation is when there are ...

Variation | CIE IGCSE Biology Revision Notes

Continuous variation is often caused by a mixture of genes and environment. For example, a girl may inherit the genes to become really tall, but if she doesn't eat nutritious food then she won't ...
