The Prosthodontic Management of Endodontically Treated ...
Periodontal health is critical to the long term success of teeth that have been endodontically treated and restored. Periodontal condition must be assessed before endodontic treatment, and the effect of planned restoration on the attachment apparatus must be considered. Any structural defects of teeth should be considered that jeopardize coronal restoration. Extensive caries, tooth fracture, previous restoration, perforation and external resorption can destroy tooth structure at the level of ...

After endodontic therapy a tooth must be restored to functional and esthetic demands. Endodontically treated teeth which are to be used as abutments in prosthodontic reconstructions, must be judged carefully regarding their ability to withstand a higher load than a single tooth normally is exposed to. Keywords: Post, Core & Ferrule. References:

Abstract - IDJSR
Introduction: The restoration of endodontically treated tooth is an essential aspect in dental practice, and its longevity has been dramatically enhanced by advanced development made in endodontic and prosthodontic restorative procedures and wide range of treatment option of varying complexity. A large number of endodontically treated teeth are restored to their original form and function with use of crown, bridge and most commonly intraarticular devices such as convention or prefabricated ...
